

Dassault Systèmes is a scientific company of 16,000 passionate people. It has today 220,000 enterprise customers coming from 12 different industries in 140 countries. The Dassault Systèmes purpose is to enable these businesses and people to imagine sustainable innovations capable of harmonizing product, nature and life.

Across the Aerospace & Defense industry, rising lower costs, higher standards and increase capabilities, along with growing program complexity make it more challenging to compete. How do companies adapt?

Both Original Equipment Manufacturers and suppliers are accelerating innovation, driving efficiencies and moving to the factory of the future to allow for greater agility on production rate. To address these business challenges, leaders require a new way to conceptualize, design, manufacture, test, certify and sustain new air and space vehicles to disrupt the mature aerospace industry.

Dassault Systèmes 3DEXPERIENCE® platform provides industry standard digital continuity to meet production rate and quality goals. Leveraging the platform an enterprise connects digitally through data-driven apps using one complete product definition. Team members have functional views on the same data based on their role. Accessing the platform, it's possible to develop a 'digital twin' -- a virtual representation of the physical aircraft -- to model, simulate and virtually test a product before launching to the market. In addition, real-time Key Performance Indicators and powerful analytics apps offer the power to see the future and correct errors before they occur in production, improving production rates.
